Importance of Mobilization Positioning by the nursing staff of the pediatric burn patient

Author: Dayana Paredes RN

Limb elevation, mobilization every two hours, passive and active exercises

Objective

To demonstrate the impact of adequate mobilization and positioning of the lower limbs to avoid contractures and ulcers in burned patients.

Methodology and results

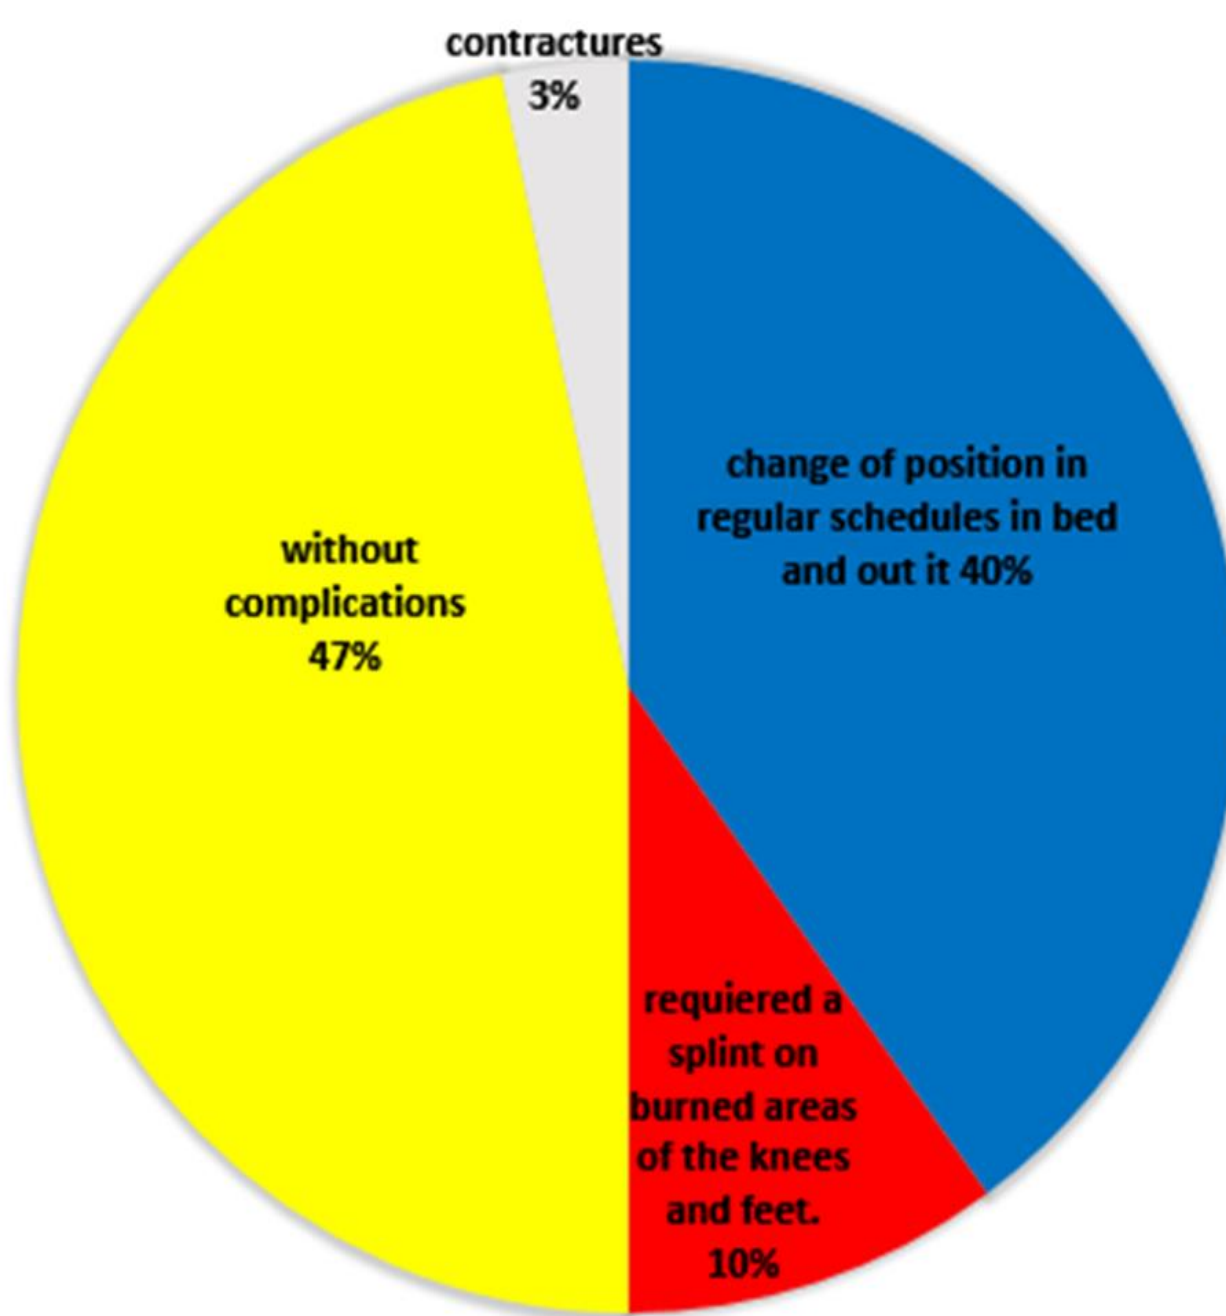

Figure 1. Complications

Conclusions

Adequate mobilization and positioning of the burned patient in the acute stage will reduce the risk of the patient suffering from pressure ulcers, decreases the edema of burned areas, favors the preservation of joint ranges and avoids vicious positions secondary to pain.

Clinical Practice

The study demonstrates the effectiveness of early mobilization and positioning to prevent functional complications in pediatric burn patients
